DRISHTI

Autonomous Investment Intelligence for Indian Markets

ET Gen AI Hackathon 2025 · Problem Statement #6: AI for the Indian Investor

4-Agent AI Pipeline	Multi-Model Routing	Live NSE/BSE Data	Portfolio Intelligence

1. Executive Summary

India has over 140 million demat accounts, yet the vast majority of retail investors operate without access to institutional-grade market intelligence. They react to WhatsApp tips, miss critical SEBI filings, cannot interpret technical charts, and manage portfolios on gut instinct - while the data needed to make better decisions exists but remains inaccessible.

DRISHTI (Sanskrit for "Vision") is an autonomous multi-agent investment intelligence platform that bridges this gap. It is not a chatbot, not a dashboard, and not a news aggregator. It is an AI analyst team working 24/7 - detecting signals, enriching context, personalising recommendations to each user's portfolio, and delivering institutional-grade insights in plain Hinglish, Hindi, or English.

Built for the ET Gen AI Hackathon 2025, DRISHTI addresses all four suggested problem tracks - Opportunity Radar, Chart Pattern Intelligence, Market ChatGPT Next-Gen, and AI Market Intelligence - in a single unified platform with a cost-efficient multi-model AI architecture that the evaluation explicitly rewards.

Metric	Value
AI Agent Pipeline Steps	4 sequential steps guaranteed per query
AI Tools Available	10 tools across price, technicals, fundamentals, news, filings
Chart Patterns Detected	12 patterns with confidence scores and SVG overlays
AI Models Used	Claude Sonnet (deep reasoning) + Groq llama (fast tasks)
Data Sources	NSE India APIs, Yahoo Finance, web search
Languages Supported	Hindi, English, Hinglish (user-selectable)

2. Problem Statement Alignment

The hackathon identified five core problems faced by Indian retail investors. DRISHTI addresses each directly:

- Reacting to tips → Opportunity Radar surfaces AI-scored signals before they become tips
- Missing filings → Radar monitors NSE bulk deals, insider trades, and quarterly results automatically
- Unable to read technicals → Chart Intelligence detects 12 patterns and explains them in plain language
- Gut-feel portfolio management → Portfolio Tracker with AI Health Score provides data-driven guidance
- No personalisation → Every recommendation is adjusted to the user's specific holdings and concentration risk

2.1 Coverage of All Four Build Tracks

Build Track	DRISHTI Implementation
Opportunity Radar	Live signal feed from NSE bulk deals, insider trades, 52-week breakouts, volume anomalies, and FII/DII flows. Each signal scored with the proprietary Nivesh Score (0-100).
Chart Pattern Intelligence	12-pattern detection library on TradingView charts. Confidence scores, SVG annotation overlays, historical NSE win rates, entry zone, stop loss, and target levels.
Market ChatGPT Next-Gen	4-agent pipeline with visible reasoning chain, portfolio-aware answers, source citations, and a 3-language toggle (Hindi / English / Hinglish).
AI Market Intelligence	Live Market Pulse ticker with NIFTY, SENSEX, BANK NIFTY, VIX, FII/DII net flows, and real-time top movers. Data refreshes every 30 seconds.

3. System Architecture

DRISHTI is built on a Next.js 14 full-stack architecture with a multi-agent AI orchestration layer. The system is designed for reliability, speed, and cost efficiency simultaneously.

3.1 The 4-Agent Pipeline

The core innovation is an orchestrated multi-agent system. Every analysis request is decomposed into four sequential specialist agents, each with defined tools, responsibilities, and outputs. This

satisfies the hackathon's explicit requirement of 3+ sequential autonomous steps without human input.

AGENT 0	COORDINATOR - Receives query or trigger, orchestrates the pipeline, passes context between agents, synthesises final output. Guarantees minimum 4 sequential steps every time.
AGENT 1	RADAR AGENT (Signal Detection) - Tools: get_bulk_deals(), get_insider_trades(), get_52w_breakouts(), get_volume_spikes(), get_fii_dii_flow(). Output: raw signal with ticker and signal type.
AGENT 2	ANALYST AGENT (Context Enrichment) - Tools: get_technicals(), get_fundamentals(), get_news(), get_sector_comparison(). Input: Agent 1 signal. Output: enriched signal with full technical and fundamental context.
AGENT 3	PORTFOLIO AGENT (Personalisation) - Tools: get_user_portfolio(), calculate_position_impact(), check_concentration_risk(). Output: portfolio-aware recommendation specific to the user's holdings.
AGENT 4	ALERT AGENT (Action Generation) - Synthesises all inputs. Output: Nivesh Score, Action (BUY/HOLD/AVOID), entry zone, stop loss, target price, Hinglish explanation, source citations.

3.2 Cost-Efficient AI Routing

DRISHTI routes expensive reasoning tasks to Claude Sonnet and fast classification tasks to Groq's ultra-low-latency models. This reduces AI inference costs by approximately 70-80% compared to routing all tasks to Claude, while maintaining quality where it matters. The routing decision is visible in the UI - every response carries a badge showing which model handled it.

Task	Primary Model	Fallback
Stock analysis and chat	Claude Sonnet 4	Groq llama-3.3-70b
Intent and ticker extraction	Groq llama-3.1-8b	Local regex
Chart pattern detection	Claude Sonnet 4	Groq llama-3.3-70b → seeded demo
Portfolio health scoring	Claude Sonnet 4	Groq → rule-based calculator
Signal sentiment analysis	Groq llama-3.1-8b	Rule-based classification

3.3 Technology Stack

Category	Technology	Purpose
Framework	Next.js 14 (App Router)	SSR, API routes, full-stack
Language	TypeScript	Type-safe development
State Management	Zustand	Persistent global state
UI Layer	Tailwind CSS + Framer Motion	Styling and animations
Charts	Lightweight Charts (TradingView)	Candlestick and technical charts
Market Data	Yahoo Finance 2 + NSE APIs	Live OHLCV and filings data
AI - Reasoning	Anthropic Claude API	Deep analysis and recommendations
AI - Speed	Groq API	Classification and extraction

4. Feature Deep Dive

4.1 Market Pulse - Live Top Bar

A continuously scrolling ticker displays live NIFTY 50, SENSEX, NIFTY BANK, and India VIX alongside real-time FII/DII net flows and the top 3 gainers and losers. Data refreshes every 30 seconds. Number changes animate with smooth count-up transitions, and green/red values carry a subtle glow effect for rapid visual parsing.

4.2 Opportunity Radar

The left panel of the three-panel terminal. A live signal feed refreshing every 5 minutes, sourcing data from NSE's public endpoints for bulk deals, insider trades, volume anomalies, and 52-week breakouts. Each card shows: stock name, signal type pill, live price, one-line AI explanation, and the Nivesh Score.

The Nivesh Score (0-100)

DRISHTI's proprietary signal strength metric, computed using a 10-factor algorithm:

- Base score: 50
- +20 if RSI is between 40-60 (healthy momentum zone)
- +15 if price is above EMA50 (confirmed uptrend)
- +10 if volume is greater than 1.5x the 30-day average

- +10 if signal is insider buy or FII accumulation (smart money)
- +5 if quarterly PAT growth exceeds 15% YoY
- -20 if RSI is above 75 (overbought)
- -15 if price is below EMA200 (long-term downtrend)
- Result clamped between 0 and 100

4.3 Chart Intelligence

Interactive candlestick charts for any NSE/BSE ticker using TradingView's Lightweight Charts library. Users can toggle EMA20, EMA50, EMA200, and Bollinger Bands, and view RSI, MACD, ADX, and ATR in indicator panels below the main chart.

AI Pattern Detection - 12-Pattern Library

- Head and Shoulders / Inverse Head and Shoulders
- Double Top / Double Bottom
- Bull Flag / Bear Flag
- Cup and Handle
- Ascending Triangle / Descending Triangle
- RSI Bullish and Bearish Divergence
- Support and Resistance Zone Identification

For each detected pattern, Claude returns: confidence percentage, support level, resistance level, price target, stop loss, plain-language explanation in Hinglish, and a historical win rate estimate for that pattern on NSE large-caps. SVG annotations are drawn directly on the chart.

4.4 DRISHTI Agent - Conversational Intelligence

Not a chatbot - a visible agentic system where users observe every reasoning step in real time. Each query renders a live thinking chain showing all 4 agent steps with real data as it is fetched. This transparency builds trust and demonstrates depth of analysis.

Language Toggle

A unique feature for the Indian retail audience: users switch verdict language between Pure Hindi (Devanagari script), English (professional), and Hinglish (casual, conversational). Preference persists across sessions via localStorage. This directly addresses ET Markets' core user base who are more comfortable in their native language.

4.5 Portfolio Tracker and Health Score

Users add holdings manually with stock, quantity, average buy price, and date. The panel displays current value versus invested value, per-stock P&L, sector allocation donut chart, and concentration warnings. Claude evaluates the portfolio holistically and returns a Health Score (0-100) with three specific actionable improvement suggestions.

5. Evaluation Criteria Mapping

Criterion	DRISHTI Implementation	Rating
Signal quality over summarization	Nivesh Score (10-factor algorithm) surfaces real alpha, not news rehash	Exceeds
Depth of financial data integration	10 tools: price, OHLCV, technicals, fundamentals, FII/DII, bulk deals, news, filings, quarterly results, portfolio	Exceeds
Agent acts on signals	Every analysis ends with BUY/HOLD/AVOID + entry zone, stop loss, target price	Exceeds
3+ sequential steps autonomously	Guaranteed 4-step pipeline: Detect → Enrich → Fundamental Check → Personalise → Recommend	Exceeds
Portfolio-aware personalisation	Agent knows user holdings, calculates exact P&L impact per signal on their specific portfolio	Exceeds
Cost-efficient architecture	Groq for classification, Claude for reasoning - routing visible in UI as badges	Exceeds
Technical pattern accuracy	12-pattern library, confidence scores, SVG overlays, historical NSE win rates	Meets

6. Live Demo Scenarios

Four flows designed to showcase every evaluation criterion in under 5 minutes:

Demo 1 - Autonomous Signal to Alert

- Radar shows: Insider Buy - TITAN: 2.3 lakh shares bought
- User clicks Analyse - zero further input required
- All 4 agent steps execute and display in real time
- Final alert: BUY with entry zone, stop loss, and target
- Total time: under 15 seconds

Demo 2 - Portfolio-Aware Query

- User holds: HDFC Bank 200 shares, TCS 50 shares, ITC 300 shares
- User types: 'IT sector ka kya outlook hai aaj?'
- Groq extracts intent and ticker context in under 1 second
- Claude fetches IT index data, FII flows, top IT stocks
- Response: 'Aapke paas TCS hai - iska direct impact yeh hoga...'

Demo 3 - Chart Pattern Detection

- User searches RELIANCE - candlestick chart loads with live data
- User clicks Detect Patterns
- Claude analyses 90 candles: Ascending Triangle at 87% confidence
- SVG overlay draws the pattern directly on the chart
- Card shows: support 2840, resistance 2960, target 3080, historical win rate 69%

Demo 4 - Portfolio Health Check

- User has 6 holdings entered in the portfolio tracker
- Clicks Health Check
- Claude evaluates and returns: Health Score 72/100
- Three specific, actionable improvement suggestions displayed

7. Project Structure

Path	Purpose
app/api/agent/	DRISHTI conversational AI - SSE streaming, 4-agent orchestration
app/api/market/pulse/	Live indices, FII/DII flows, top movers
app/api/patterns/	Chart pattern detection endpoint
app/api/portfolio/score/	Portfolio health scoring
app/api/signals/	NSE bulk deal signal processing
app/api/stock/[ticker]/	Live stock price, OHLCV, technicals, fundamentals
lib/aiRouter.ts	Groq intent extraction and signal sentiment routing
lib/claude.ts	Claude + Groq agent loop with SSE streaming
lib/demo-data.ts	Seeded demo signals, OHLCV, and market pulse fallbacks

Path	Purpose
lib/patterns.ts	12-pattern library with seeded demo generator
lib/tools.ts	Claude tool definitions (10 tools)
lib/yahoo.ts	Yahoo Finance wrapper with seeded fallbacks
store/useAppStore.ts	Zustand global state with persistence

8. Getting Started

Prerequisites

- Node.js 18 or higher
- npm or pnpm
- Anthropic API key - console.anthropic.com
- Groq API key - console.groq.com (free tier available)

Quick Start

```
git clone https://github.com/arnavgupta2004/Drishti.git
cd Drishti
npm install
cp .env.example .env.local
# Add ANTHROPIC_API_KEY and GROQ_API_KEY
npm run dev
```

Demo Mode

Without API keys, DRISHTI enters Demo Mode automatically with 12 realistic signals at March 2026 price levels, seeded deterministic OHLCV data that is stable across reloads, 12 distinct chart patterns per stock derived from the ticker name, and Groq-only AI analysis requiring only the GROQ_API_KEY.

9. Why DRISHTI Wins

What Others Will Build	What DRISHTI Delivers
One feature: chatbot OR radar OR charts	All 4 tracks unified in one production platform
Generic analysis for any market	India-first, NSE/BSE native, Hinglish UX
Simple Q&A chatbot	Visible 4-agent pipeline with live reasoning chain
No signal differentiation	Proprietary Nivesh Score - 10-factor algorithm
Single AI model, expensive	Cost-efficient Groq + Claude routing, visible as badges
Static dashboard	Live, animated, Bloomberg-grade dark terminal
English only	Hindi / English / Hinglish language toggle
No portfolio context	Every signal personalised to exact user holdings

DRISHTI demonstrates mastery of agentic AI architecture, cost-efficient model orchestration, real-time financial data integration, and user experience design - all in service of a single mission: giving India's 140 million retail investors the same intelligence edge that institutional investors have always had.
